

AMENDMENT TO THE SPECIFICATION

Please replace the bridging paragraph of pages 8-9 as follows:

Injection site 14 comprises a tubular housing 16 having a passageway 18 for containment of fluids, the inner wall of which comprises tubing 12. An elastomeric wall 20 is provided, which has a slit or perforation 22 to comprise a fixedly placed, flexible barrier across opening 21 to close off bore portion 32 and passageway 18. Elastomeric wall 20 is laterally secured at its periphery 24 at an end of housing 14 in a strong, sealing manner. It can be seen that the outer face 25 of elastomeric wall 20 is exposed to the exterior for access from lateral directions, to facilitate the use of an antiseptic-bearing swab, such as a commonly available isopropyl alcohol swab, to clean outer surface 25 26.
